

Building Entrance Facility Solutions

Bandwidth without boundaries

COMMScope®

Building Entrance Facility Solutions

The forward-looking facilities designer knows that fiber counts in both outside plant (OSP) and Intra-Facility Cable (IFC) increase rapidly, sometimes even before a project finishes. A critical piece of an advanced design is the building entrance termination point, where the OSP and IFC cables are joined, managed, distributed and protected.

CommScope has engineered its building entrance cabinet line to solve the most demanding requirements of an advanced building entrance strategy:

DENSITY

CommScope's building entrance cabinets support 10,000 plus ribbon fibers in a single cabinet.

SPACE EFFICIENCY

Our cabinets are sized from small to very large to use only the space that is necessary for your design.

FLEXIBILITY

Our cabinets support small to very large cables (3456 fibers and more) in the same space, without sacrificing cable support or smooth routing, and are available in floor mount and wall mount options.

ACCESSIBILITY

These products enable seamless access to each tray both during initial installation and when adding cables later. Each incoming and outgoing cable and subunit may be accessed individually at any time.

INSTALLER FRIENDLINESS

Cables flow in a logical and uncluttered manner throughout the cabinets, speeding installation, documentation and cable adds in the future.

ROBUSTNESS

Heavy duty construction and hardware protect cables and splices even in high traffic areas and during facility expansion.

CommScope knows how critical it is that every piece of your network infrastructure is optimized to the task at hand - and the unexpected tasks in the future. Our building entrance cabinet line is engineered to today's applications - and tomorrow's.

Universal Splice Cabinet

Introduction

Designed for flexibility and user friendliness, the Universal Mounted Splice Cabinet has the ability to mount in a 19" or 23" two or four post rack. It can also be mounted on the wall. This high density solution allows for up to 6912 in the 24 tray cabinet size, and 3456 slices in the 12 tray cabinet size, which are easily accessible due to the dedicated mesh tubing routing. The Universal Mounted Splice Cabinet's unique design includes over 6 feet of slack to allow up to 3 splicers to be working side-by-side at the same time.

FEC Wall Mount Frame

Introduction

CommScope's FEC Wall Mount Frame provides splicing, administration and storage for outside plant (OSP) and intrafacility cables (IFC). The cabinets are designed for deployment in a building equipment area and offers a cost-effective, space-saving alternative to splicing on the fiber frame.

Equipped with splice drawers and available in several configurations, the FEC's largest configuration accommodates up to 3456 stranded fibers or 10,368 ribbon fibers. Bend radius protection and discrete subunit routing paths ensure easy access and prevent excess attenuation.

The FEC cabinets accommodates a wide variety of cable types and splicing methods. They are also safety listed in UL file E114344 Volume 4 Section 1.

PRODUCT OVERVIEW

RECOMMENDED APPLICATIONS	Off-frame splice location for outside plant (OSP) cables to be spliced to intrafacility (IFC) cable
DESCRIPTION	Accommodates multiple fiber splicing requirements with various cabinet sizes
CABLE MANAGEMENT	Superior
ROUTING PATHS	Clear
PHYSICAL PROTECTION	Robust
ACCESS SPLICE POINT	Easy

FEC Floor Mounted Frame

Fiber splice cabinets

The splice cabinet is a zone 4 rated, high-density splice solution, housing stranded fiber splices and ribbon fiber splices within a 24" W x 12" D X 7' H. Shipped complete with the necessary cable management, it features slots which secure and protect the round splice trays and can hold up to sixty splice trays on each vertical. The cabinet is shipped with lockable front doors and may be ordered for applications in which the cables enter from above or below.

The splice cabinet is offered in putty and black versions.

Building Entrance Breakout Kits

MESH BREAKOUT KITS

Mesh Breakout Kits create a simple and craft friendly installation with a significant reduction in time compared to plastic, transportation tube style breakout kits.

- Supports both standard matrix style ribbon and pliable ribbon fibers.
- Allows for easier routing with reduced congestion.
- Lower cost versus plastic transportation tube style breakout kits.

Accessories

Breakout Kit for Ribbon in Loose Buffer Tube (RLBT) OSP Cable

Ribbon in loose buffer tube OSP cables are constructed as shown in Figure 1. All RLBT cables feature six subunits surrounding a central strength member. Depending on the fiber count of the cable, some of the subunits may be used as filler subunits (a solid plastic unit without any fiber). Each subunit containing fiber is comprised of six or twelve ribbons featuring 12 fibers per ribbon.

Breakout kits for RLBT cables contain multiple breakout bases, each with 5-meter lengths of protective tubing (see Figure 2). The protective tubing accommodates up to six ribbons. One breakout kit fits into each individual subunit. For mass fusion ribbon splicing applications in the FEC, CommScope recommends splicing up to 72 fibers (six ribbons) in a dual splice tray. The tray should be equipped with an “MT” splice chip (see page 94 for information on mechanical or mass fusion ribbon trays). For single fusion splicing applications, CommScope recommends 24 fibers per drawer using either two single trays or one dual tray. This kit is used to protect fiber ribbons between the cable clamp and the splice tray.

Breakout kits are designed for use in controlled environments only.

Figure 1

Ribbon buffer tube (RLBT) OSP cable

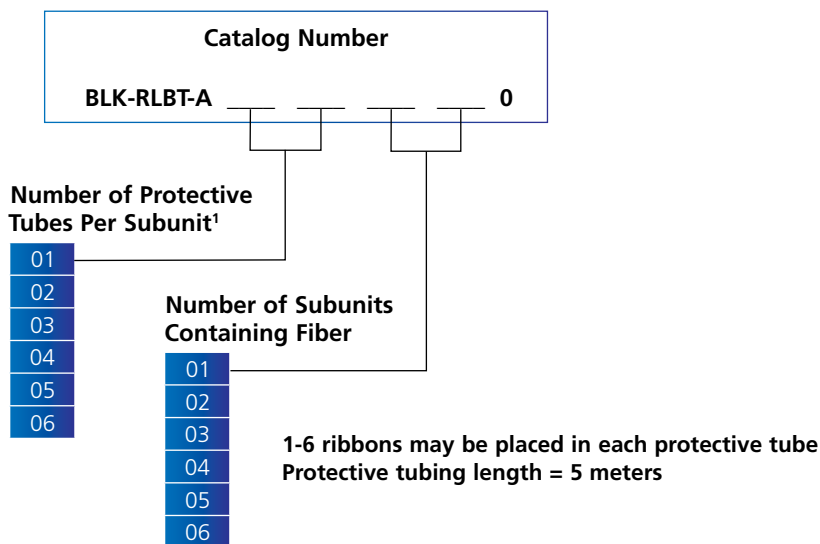

Figure 2

Breakout kit for RLBT OSP Cable

¹ The number of protective tubes per subunit is calculated as follows:

Divide the number of fibers per subunit (typically 72 or 144) by the number of fibers (12, 24, 36, 48, 72) to be spliced in each splice tray.

Example: If each subunit has 144 fibers with 36 fibers per tray, then each subunit would require four protective tubes.

Other configurations are available upon request. Please contact CommScope Technical Assistance Center.

<https://www.commscope.com/supportcenter/>

Accessories

Breakout Kit for Ribbon Central Tube (RCT) OSP Cable

Ribbon central tube OSP cables are constructed as shown in Figure 1. The ribbons in RCT cables feature 12 or 24 fibers per ribbon. Cables with 288 or more fibers are typically built with ribbons featuring 24 fibers per ribbon. Each cable consists of a single central tube that encloses the ribbons.

Breakout kits for RCT cables contain a single breakout base attached to the central tube. Protective tubing is attached to the breakout base in 5-meter lengths (see Figure 2). Smaller protective tubing can accommodate up to six ribbons featuring 12 fibers per ribbon. Larger tubing is used for ribbons with 24 fibers per ribbon.

For mass fusion ribbon splicing in the FEC, CommScope recommends splicing 72 fibers per drawer. For ribbon featuring 12 fibers per ribbon, six ribbons would be spliced in each drawer. For ribbon featuring 24 fibers per ribbon, three ribbons would be spliced in each drawer. An “MT” chip is required for mass fusion ribbon splicing in a dual splice tray.

Figure 1
Ribbon central tube (RCT)
OSP cable construction

Figure 2
Breakout kit for RCT cable

Figure 3
Breakout kit for RCT cable

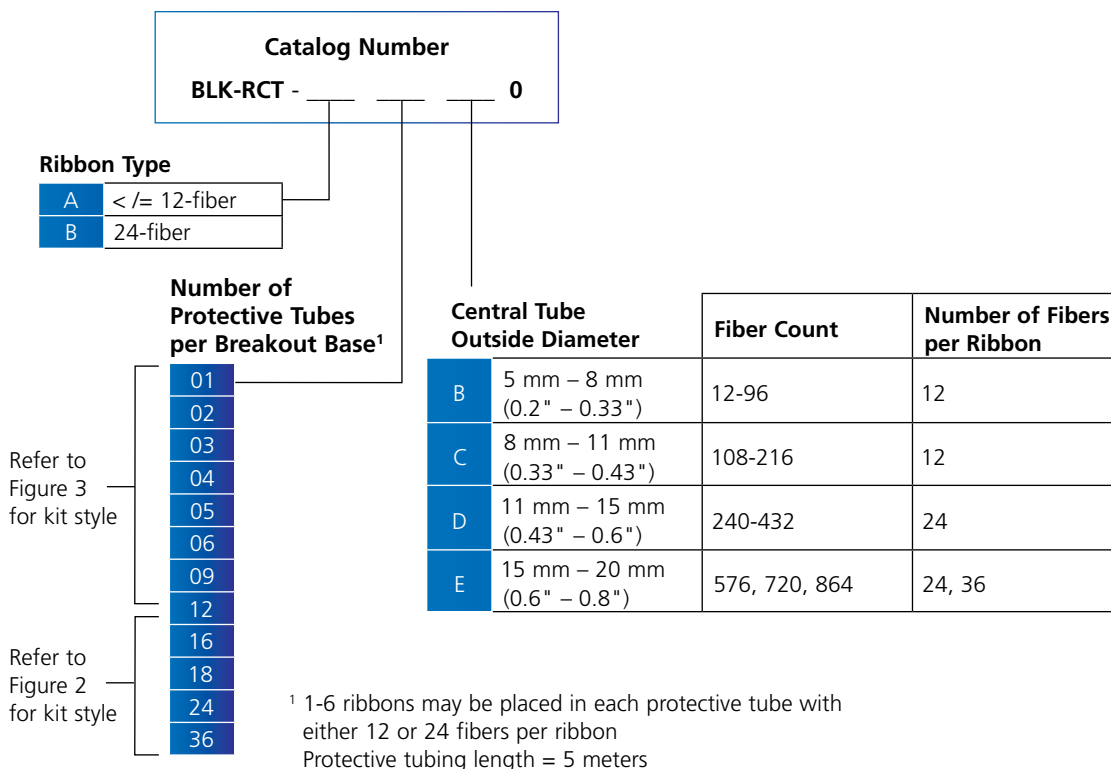

Accessories

RCT Breakout Kit Typical Configurations

432- and 864-fiber ribbon in central tube (RCT) OSP cables featuring 24 fibers per ribbon are common. The table below shows the number of protective tubes per breakout base required for 432- and 864-fiber cables based on the number of fibers per tray. This kit is used to protect fiber ribbons between the cable clamp and splice tray.

NUMBER OF FIBERS PER TRAY	NUMBER OF RIBBONS PER PROTECTIVE TUBE	432-FIBER CENTRAL TUBE OSP CABLE, 24-FIBER RIBBON	864-FIBER CENTRAL TUBE OSP CABLE, 24-FIBER RIBBON
24	1	18	36
48	2	9	18
72	3	6	12
96	4	N/A	9
144	6	3	6

Breakout kits with 36 protective tubes use a large breakout base, kits with 9–18 protective tubes use a medium breakout base and kits with 6 protective tubes use a small breakout base.

¹ The number of protective tubes per central tube is calculated as follows:

Divide the number of fibers per central tube (typically between 144 and 864) by the number of fibers (12, 24, 36, 48, 72) to be spliced in each splice tray.

Example: If the central tube has 864 fibers with 36 fibers per splice tray, then the breakout base would require 24 protective tubes.

Other configurations are available upon request. Please contact CommScope's Technical Assistance Center.

<https://www.commscope.com/supportcenter/>

Breakout Kit for Intrafacility (IFC) Ribbon Cables

CommScope’s ribbon IFC cables have a central tube construction. The ribbons in IFC cables feature 12 fibers per ribbon. A central tube encloses the ribbons and features fiber counts ranging from 24 fibers to 216 fibers. Central tubes with 72, 96, 144 and 216 fibers are most common. IFC ribbon cables are used in off-frame splicing applications where mass fusion ribbon splicing is used.

The breakout kits for IFC cables contain a single breakout base attached to the central tube. Protective tubing is attached to the breakout base in 5-meter lengths and can accommodate up to six ribbons featuring 12 fibers per ribbon.

For mass fusion ribbon splicing in the FEC, CommScope recommends splicing 72 fibers per drawer. For ribbon featuring 12 fibers per ribbon, six ribbons would be spliced in each drawer. For ribbon featuring 24 fibers per ribbon, three ribbons would be spliced in each drawer. An “MT” chip is required for mass fusion ribbon splicing in a dual splice tray.

The breakout kits for 72, 96, 144, 216 and 432 fiber IFC cables are shown in the table below. This kit is used to protect fiber ribbons between the cable clamp and the splice tray.

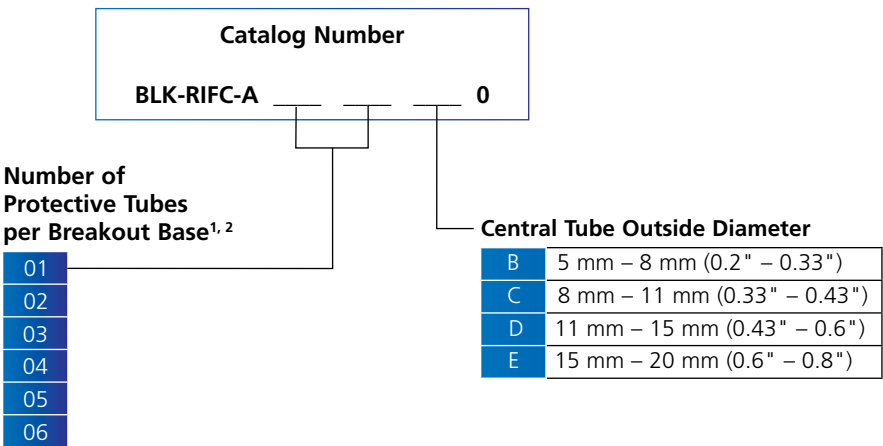

Breakout Kit for IFC Ribbon Cables

CATALOG NUMBER	IFC CABLE FIBER COUNT	NUMBER OF FIBERS PER TRAY

BLK-RIFC-A03C0	216	72
BLK-RIFC-A06E0	432	72

Accessories

IFC Breakout Kit Typical Configurations

When splicing IFC ribbon cables in the FEC cabinet, CommScope recommends 72 fibers per drawer. Fewer splices can be used, but the FEC easily accommodates 72 fibers per drawer in mass fusion ribbon splicing applications.

¹ 1–6 ribbons may be placed in each protective tube CommScope recommends 6 ribbon units (72 fibers) per tube.
Protective tubing length = 5 meters

² **The number of protective tubes per central tube is calculated as follows:**
Divide the number of fibers per central tube (typically between 72 and 216) by the number of fibers (12, 24, 36, 48, 72) to be spliced in each splice tray.
Example: If the central tube has 144 fibers with 36 fibers per splice tray, then the breakout base would require four protective tubes.

Other configurations are available upon request. Please contact CommScope's Technical Assistance Center.
